OBJECTIVE

- As PROTON e.MAS grows, customer communication channels are becoming more varied, and expectations for faster and better service are increasing.
- This project aims to build a smart and centralized complaint management system that will:
 - Combine all customer channels into one easy-to-manage platform
 - Automatically assign complaints to the right person
 - Provide quick access to helpful information for faster responses
 - Track and monitor the complaint process in real time
 - The goal is to improve customer satisfaction and enhance the brand's service image
- Current system have limitation in terms of integration, dashboard & lack of major function

OVERALL GOALS

Unified Omni-Channel Management

All customer messages—whether by phone, email, chat, or social media—will be brought together in one place for easier and more consistent handling.

Built-in Intelligent FAQ

Staff can access an intelligent FAQ and help system to give quicker and more accurate answers to customers.

Real-Time Data & Performance Tracking

Dashboards and reports will show complaint trends, team performance, and customer satisfaction—helping management make better decisions.

Complaints will be automatically assigned to the right staff based on urgency and type, with reminders to make sure nothing is missed

Smart Task Assignment & Reminders

The complaint process will run automatically from start to finish, with rules to escalate issues if there are delays or no response

Automated Workflow & Escalation Management

The system can grow and adapt to new business needs, more locations, or new customer channels in the future.

Flexible and Scalable Design

Intergration of Inbound

- All channels via Call, Email, WA or Social Media must be **automatically integrated** on the same agent interface & **displayed in a single CRM view**
- All **new inbound** will have a **pop up notification (system alert)**
- When received Call, system will have a **voice recognition & change to text**

Agent Management

- CRM system able to **check who is on duty** before escalate to agent
- The system must **support setting channel priorities** for each agent (for example, WhatsApp priority, Email priority, Call priority etc.).
- Automatic **polling task assignment** can be performed based on the current agent status (idle, busy, offline).
- If all agents in the priority channel are busy, the **system can intelligently switch and assign tasks to the agents in the idle**
- All tasks need to have "**Reminder**" and "**Timeout Warning**" functions, and support sound reminders, desktop reminders, and in-system notifications

FAQ template with AI support

- The system needs to **integrate the FAQ knowledge** base module to support the CRM team to update the FAQ content in real time.
- During the conversation between the agent and the customer, the **system can automatically match relevant FAQ entries based on chat keywords**, and prompt real-time pop-up prompts to suggest related potential replies.
- The agent **can refer to the FAQ content with one click** and can also provide **feedback and score the FAQ quality**

Escalation Process

- The system needs to support the **rule engine, according to the classification / categorization** of customer problems (department/business area) combined with SOP, to automatically:
 - Identify Person In Charge (**PIC**)
 - Automatically **notify and CC the relevant personnel by email** (can support attachments if need, like photos, videos, web link and etc.)
 - Trigger a **WhatsApp message to alert** the PIC (Optional)
- The case must have the following statuses and operations:
 - Escalate triggers an **automatic reminder of the higher-level responsible person**
 - Records of **WIP and Resolved operations**
 - All **status changes need to record information** such as Agent name, time, and remarks
- Automatic **escalation mechanisms can be configured**, such as 8-hours automatic send to higher level if there is no response, and 48-hours unresolved alarms

Customer Profile

- The system **needs to realize two-way data connection with the DMS system** (Dealer Management System) and the TSP platform (Telematics Service Provider), and when the customer contacts the call center through the hotline or WhatsApp, the **system should automatically identify the customer and display their key information.**
- **Trigger conditions:**
 - Customer contact system by phone or WhatsApp (based **on caller number or WA number**)
 - The **system calls the DMS and TSP systems through API interfaces to automatically match and pull relevant information**
 - **Customer Information** (name, gender, contact detail, address etc)
 - **Vehicle Information** (VRN, VIN, Model, Dealer Purchased, Purchased date etc)
 - **Service History** (Recent Service Date, Service Dealer, Summary of Repair Record, Status of Open RO
 - **Call Center History** (All Call history, WA communication history, emails & any social media reply or Road Side Assistance)
- After a customer calls, the **Agent page automatically pops up the Customer 360 View Card**
- The content of the card is divided into **personal information, vehicle information, service information, and Call Center history**
- All data **synchronization should take no more than 3 seconds** and support asynchronous loading

Reporting

- The system needs to integrate Power BI (or equivalent BI tools) to implement the following data visualization reports:
 - **Channel source analysis by case (Call/WA/Email or Social Media)**
 - By case division (Apps, Sales, Aftersales, Charging)
 - Daily/weekly/monthly trend chart
- **Analysis of departments and responsible persons**
 - Case distribution and resolution statistics by dealer/department/PIC
 - Ranking of first response rate, resolution rate and resolution time of each department/dealers
 - Analysis the Complaint Reopen Rate, CRR by dealers/department/PIC
- **Call Centre KPI**
 - SLA response achievement rate
 - The number of tasks processed by each agent and the average response time
 - The average response duration (first response time) and the average case closure time are based on the channel response time
 - Ranking of popular complaint types and statistics during peak complaint hours
- **NPS For Agent**
 - Customer able to rate the agent performance from Call & WA channel
- **Case life cycle tracking**
 - A map of the time distribution from creation to closing
 - Trend analysis of special states such as Higher escalation /WIP/Temporary Closed/Closed
- Reports need to be exported to PDF, Excel, and **automatically sent to management on a regular basis**
- Configurable "**Anomaly Warning Dashboard**" to achieve real-time anomaly prompts (such as the explosion of a channel)
- System should be able to run report based on request tag key work

THANK YOU

The End
